具体例子：在 $\mathbb{P}^1$ 的情形 (section 17)：

$$\sigma(s_1) \circ \sigma(s_1) = q \cdot \sigma(1)$$

这里 q 出现因为两条直线 (在 $\mathbb{P}^1$ 中) 相交于一条曲线 (亏格 0 曲线), 而不是一个点。
与经典情形的对比：

情形	代数结构	结构常数 c
经典上同调 $H^*(X)$	$\mathbb{Z}$ -代数	$c_{u,v}^w \in \mathbb{Z}_{\geq 0}$
等变量子上同调 $H_T^*(X)$	Λ -代数 ($\Lambda = \mathbb{Z}[x_i]$)	$c_{u,v}^w \in \Lambda$, 系数非负
等变量子量子上同调 $QH_T^*(X)$	分次 $\Lambda[q]$ -代数	$c_{u,v}^{w,d} \in \Lambda$, 系数非负

49. $f: \mathbb{P}^1 \rightarrow X$ 中的 X 是什么？

49.1. 问题. 在量子上同调的定义中, 出现稳定映射 $f: \mathbb{P}^1 \rightarrow X$, 这里的 X 是什么? $\mathbb{P}^1$ 又是什么?

49.2. 回答. $X = G/P$ 是齐次空间 (homogeneous space):

在 section 17 中我们看到, $X = G/P$ 是旗流形 (flag variety), 其中:

- G 是连通复半单李群 (如 $GL_n(\mathbb{C})$)
- $P \subset G$ 是抛物子群 (parabolic subgroup)
- G/P 是齐次空间, 等同于旗流形 Fl_n

$\mathbb{P}^1$ 是复射影直线:

$\mathbb{P}^1$ 是 1 维复射影空间, 也等价于 Grassmannian $Gr(1, n+1)$ 。它是一条紧致 (compact) 的复曲线, 亏格 (genus) 为 0。

稳定映射 $f: \mathbb{P}^1 \rightarrow X$ 的几何含义:

在量子上同调中, 我们不再计数点与 Schubert 簇的交点, 而是计数曲线与 Schubert 簇的交点。具体来说:

- f 是一个代数曲线 (这里是 $\mathbb{P}^1$, 亏格 0 曲线)
- f 的像 $f(\mathbb{P}^1) \subset X$ 是旗流形中的一条复曲线
- 稳定映射的模空间 $\overline{\mathcal{M}}_{0,3}(X, d)$ 参数化了所有满足特定条件的映射

与经典 Schubert calculus 的对比:

情形	计数对象	结构常数 c 的取值
经典上同调	X 中点的相交数	$c_{u,v}^w \in \mathbb{Z}_{\geq 0}$
等变量子上同调	点的相交 (等变权)	$c_{u,v}^w \in \Lambda$, 非负系数
等变量子量子上同调	稳定映射的个数	$c_{u,v}^{w,d} \in \Lambda$, 非负系数

为什么是 $\mathbb{P}^1$? 因为亏格 0 曲线 (rational curves) 在代数几何中特别重要——它们是最简单的非平凡复曲线, 而且通过 $\mathbb{P}^1$ 可以用 Kontsevich 的稳定映射模空间很好地参数化。

50. Kim 的思想如何迁移到 Mihalcea 的等变量子 Schubert 演算

50.1. 问题. Mihalcea 在论文中基于 Kim 的思想, 将等变量子 Schubert 演算定义为分次 $\Lambda[q]$ -代数。Kim 的核心思想是什么? Mihalcea 如何迁移这一思想?

50.2. 回答. Kim 的核心思想: 提升环作用 (Lifting the Torus Action)。

Kim 在 1996 年的论文 *On equivariant quantum cohomology* 中的核心 insight 是: 把量子上同调的整套 machinery 提升到等变范畴。具体而言:

- (1) T -作用提升: 如果 torus T 作用在齐性空间 $X = G/P$ 上, 这个作用自然地诱导出在 Kontsevich 稳定映射模空间 $\overline{\mathcal{M}}_{0,n}(X, d)$ 上的 T -作用。

- (2) **等变评估映射**：评估映射 $ev_i : \overline{\mathcal{M}}_{0,n}(X, d) \rightarrow X$ 是 T -等变的，因此可以把 X 上的等变 Schubert 类拉回到模空间。
- (3) **等变 Gromov-Witten 不变量**：因为映射是等变的，得到的不是整数（普通量子上同调），而是 $\Lambda = H_T^*(pt) = \mathbb{Z}[x_1, \dots, x_r]$ 中的多项式——即等变 Gromov-Witten 不变量。
- (4) **结合性 (WDVV 方程)**：Kim 证明了这些新的不变量满足 WDVV (Witten-Dijkgraaf-Verlinde-Verlinde) 方程，从而确保了 graded $\Lambda[q]$ -代数上的量子杯积是结合的。

Mihalcea 的迁移方式：Mihalcea 直接采用了 Kim 的这套 $\Lambda[q]$ -代数框架作为他的 Schubert 演算的代数基础。Kim 的工作保证了：

- 等变 Gromov-Witten 不变量是定义良好的；
- 量子上积在 $\Lambda[q]$ 上是结合的；
- 结构常数（等变量子 Littlewood-Richardson 系数） $c_{u,v}^{w,d}$ 形成一个相干的环。

然后 Mihalcea 在这个代数存在性的基础上，**结合 Graham 的几何横截性和投影公式**，来证明这些结构常数不仅存在，而且具有非负系数的正性 (positivity)。

核心洞察：Kim 的贡献是范畴化的提升（从整数到多项式），Mihalcea 的贡献则是利用这个提升的结构来证明正性。¹⁸

¹⁸问：Kim 的思想如何迁移到 Mihalcea 的等变量子 Schubert 演算？见附录 section 50。
